T2D can cause damage to various organs and lead to disease complications, including CKD

T2D, type 2 diabetes; CKD, chronic kidney disease

1. International Diabetes Federation. IDF Diabetes Atlas, 9th ed. Brussels, Belgium; 2019; 2. National Kidney Foundation. National Kidney Foundation. *Am J Kidney Dis* 2007;49(suppl 2):S1–S180; 3. United States Renal Data System. 2018 Annual Data Report. Volume 2, ESKD: Chapter 1; 4. United States Renal Data System. 2018 Annual Data Report. Volume 2, ESKD: Chapter 11; 5. United States Renal Data System. 2019 Annual Data Report. Executive summary

CKD progression in T2D is driven by the combined effects of metabolic, haemodynamic, and inflammatory and fibrotic factors

Kidney disease approximately triples the risk of CV mortality in patients with CKD and T2D compared to patients with CKD alone¹

10-year standardised CV mortality (%)

Data from the NHANES III study suggested that excess risk for CVD among patients with diabetes was concentrated among patients with kidney disease (defined as albuminuria, impaired eGFR, or both).¹

CV, cardiovascular; NHANES III, Third National Health and Nutritional Examination Survey; CKD, chronic kidney disease; T2D, type 2 diabetes; CVD, cardiovascular disease; eGFR, estimated glomerular filtration rate

1. Afkarian M et al. *J Am Soc Nephrol.* 2013;24:302-308.

T2D causes structural changes in the kidney glomerulus¹

Loss of podocytes with
denuding of the
glomerular basement
membrane

Other diabetes induced changes

Glomerulosclerosis¹⁻³

Thickened glomerular basement membrane and mesangial expansion are accompanied by accumulation of AGEs, leading to glomerulosclerosis²

Glomerular hypertrophy¹⁻⁴

Glomerular hypertrophy is associated with an increase in eGFR, mainly caused by increased plasma flow and glomerular capillary hydrostatic pressure

T2D, type 2 diabetes; AGE, advanced glycation end-product; GFR, glomerular filtration rate

CKD progression in T2D is driven by the combined effects of metabolic, haemodynamic and inflammatory and fibrotic factors

DIABETES

Pathogenic mechanisms for kidney injury¹

Metabolic factors^{1,2}

- Kidney responds to **hyperglycaemia** by prompting diverse intracellular processes, including:
 - Alteration in cellular **energy production** ($\uparrow$ NADPH)
 - Activation of different enzymes (e.g. **PKC**)
 - Enhanced **flux of polyols** and hexosamine
 - Generation of **AGEs and ROS**
 - Activation of **transducer signalling pathways** ($\uparrow$ TGF- β)

Haemodynamic factors¹

- **Hyperglycaemia** induces activation of local kidney **RAAS**, leading to:
 - **Systemic hypertension**
 - **Intraglomerular hypertension**
 - **Glomerular hyperfiltration**
 - **Impaired kidney vascular regulation**
 - **Altered sodium/fluid balance**

Inflammatory and fibrotic factors³

- Metabolic and haemodynamic abnormalities induced by diabetes, including **hyperglycaemia** and **AGEs**, lead to release of **proinflammatory cytokines** (e.g. IL-1 IL-6, TNF- α)
- Other activated inflammatory molecules and pathways include:
 - Chemokines
 - Innate immune cells
 - Adhesion molecules

AGE, advanced glycation end-product; CKD, chronic kidney disease; IL-1, interleukin-1; IL-6; interleukin-6; NADPH, nicotinamide adenine dinucleotide phosphate; PKC, protein kinase C; RAAS, renin-angiotensin-aldosterone system; ROS, reactive oxygen species; T2D, type 2 diabetes; TGF- β , transforming growth factor beta; TNF- α , tumour necrosis factor alpha

Aldosterone and Mineralocorticoid Receptor in Physiology and Pathophysiology

Mechanisms and contribution of MR in kidney diseases

ORIGINAL ARTICLE

Anti-albuminuric effects of spironolactone in patients with type 2 diabetic nephropathy: a multicenter, randomized clinical trial

Sawako Kato¹ · Shoichi Maruyama¹ · Hirofumi Makino² · Jun Wada² · Daisuke Ogawa² · Takashi Uzu³ · Hisazumi Araki³ · Daisuke Koya⁴ · Keizo Kanasaki⁴ · Yutaka Oiso⁵ · Motomitsu Goto⁵ · Akira Nishiyama⁴ · Hiroyuki Kobori⁶ · Enyu Imai⁷ · Masahiko Ando⁸ · Seiichi Matsuo¹

Conclusions Spironolactone reduced albuminuria along with conventional RAS inhibitors in patients with diabetic nephropathy. Our study suggests that spironolactone exerts anti-albuminuric effects independent of systemic hemodynamic alterations.

activity in the kidney. In conclusion, our study suggests that spironolactone could be recommended as a second-line treatment for patients with type 2 diabetes and nephropathy, when the control of blood pressure or albuminuria is insufficient under the RAS blocker-based therapy.

Fig. 1 Line plot showing mean urinary albumin-to-creatinine ratio (a), mean serum creatinine (b) and mean estimated glomerular filtration rate (c). The squares represent the control group (Group C) and the circles represent the spironolactone group (Group S)

Spironolactone is a non-selective steroidal MRA

gynecomastia

menstrual irregularities

impotence

• Significant increase in the risk of hyperkalemia with the addition of spironolactone to ACEi and/or ARB (relative risk 3.06, 95% CI 1.26, 7.41).

Differential MR binding of steroidal MRAs vs finerenone results in distinct effects on gene expression

	Aldosterone antagonists		Finerenone
	 Spironolactone	 Eplerenone	 Finerenone
Structural properties	Flat (steroidal)	Flat (steroidal)	Bulky (nonsteroidal) ^{1,5}
Potency to MR	High ^{4,10}	Moderate ^{1,4,10}	High ^{1,2,10}
Selectivity to MR	Low ^{4,10}	Moderate ^{4,10}	High ^{1,2,10}
CNS penetration	Yes	Yes	No based on preclinical data ³
Gynecomastia	Yes ⁴	Less than spironolactone ⁴	No signal in phase II studies ⁷⁻⁹
Hyperkalaemia	Yes ⁴	Yes ⁴	Moderately increased ^{*,7-9}
Tissue distribution	Kidney > heart (at least 6-fold) ^{6,10}	Kidney > heart (~3-fold) ^{6,10}	Balanced kidney : heart (1:1) ^{6,10}

MR overactivation causes kidney and cardiovascular damage

Finerenone, a novel, selective, non-steroidal MRA, blocks MR overactivation

Mechanism of action of the non steroidal mineralcorticoid receptor antagonist: FINERENONE

The phase III study programme is investigating renal and CV outcomes with finerenone in patients with CKD and T2D

Phase II studies

ARTS¹ (N=457)

Patients with HF (LVEF ≤40%) and mild CKD

Well tolerated with **less hyperkalaemia** vs spironolactone

ARTS-DN² (N=823)

Patients with T2D and albuminuria

Dose-dependent **reduction in albuminuria** with similar adverse events to placebo

ARTS-HF³ (N=1066)

Patients with HFrEF and CKD and/or T2D

Well tolerated with **comparable safety** to eplerenone

Phase III trial programme

Patients with CKD and T2D (persistent high or very high albuminuria)

N≈13,000

Finerenone reducing **kidney failure and disease progression** in patients with CKD and T2D

Finerenone reducing **cardiovascular mortality and morbidity** in patients with CKD and T2D

CKD, chronic kidney disease; HFrEF, heart failure with reduced ejection fraction; LVEF, left ventricular ejection fraction; T2D, type 2 diabetes

FIDELIO-DKD and FIGARO-DKD are investigating effects of finerenone on kidney and CV outcomes in patients with CKD and T2D

	 FIDELIO-DKD ¹	 FIGARO-DKD ²
Clinical efficacy primary endpoint	 Composite endpoint: time to onset of kidney failure* or decrease of eGFR $\geq 40\%$ from baseline or death due to kidney disease	 Composite endpoint: time to CV death, non-fatal MI, non-fatal stroke or hospitalisation for HF

Finerenone significantly reduced the risk of the primary composite kidney endpoint vs placebo

Time to kidney failure*, sustained $\geq 40\%$ decrease in eGFR from baseline[#], or renal death

*ESKD or an eGFR <15 ml/min/1.73 m²; [#]sustained over ≥ 4 weeks; [‡]over a median follow-up of 2.6 years
Bakris GL, et al. *N Engl J Med* 2020; doi: 10.1056/NEJMoa2025845

On top of maximum tolerated RAS therapy, finerenone significantly reduced the risk of the primary CV outcome by 13%

Time to CV death, non-fatal MI, non-fatal stroke or HHF

*Number of patients with an event over a median of 3.4 years of follow-up
[FIGARO primary-placeholder]

FIDELIO-DKD and FIGARO-DKD assessed prespecified kidney outcomes in patients across the spectrum of CKD severity

FIDELITY is a large prespecified individual patient-data meta-analysis of the FIDELIO-DKD and FIGARO-DKD phase III trials¹⁻³ including CV- and kidney-specific composite outcomes across the spectrum of CKD stages

FIDELITY

prespecified pooled analysis³

Total N=13,171

CV composite outcome

Time to first occurrence of:

- CV death*
- Non-fatal MI
- Non-fatal stroke
- Hospitalisation for HF

Kidney composite outcome

Time to first occurrence of:

- Onset of kidney failure:
 - ESKD (initiation of chronic dialysis for ≥90 days or kidney transplantation)
 - Sustained eGFR <15 ml/min/1.73 m²#
- A sustained ≥57% decrease of eGFR from baseline*
- Renal death†

*Please refer to the slide notes section for footnotes

CV composite outcome: Summary

- In patients with CKD stage 1–4 with moderate-to-severely elevated albuminuria and T2D, with well-controlled blood pressure and HbA1c, and treated with optimised RAS therapy:

- **Finerenone significantly reduced the risk of CV morbidity and mortality by 14% (equivalent to an HR of 0.86) vs placebo**
 - With consistent effects irrespective of region, baseline CKD severity, blood pressure, HbA1c and serum [K⁺]
 - Absolute risk reduction = **2.2%** at 3 years
- **CV benefits of finerenone were clinically relevant**
 - NNT to prevent one CV outcome event over 3 years = 46

Kidney composite outcome*: Summary

- In patients with CKD stage 1–4 with moderate-to-severely elevated albuminuria and T2D, with well-controlled blood pressure and HbA1c, and treated with optimised RAS therapy:

- **Finerenone significantly reduced the risk of the $\geq 57\%$ eGFR kidney composite outcome* by 23% (equivalent to an HR of 0.77) vs placebo**
 - With consistent effects on the components of the $\geq 57\%$ eGFR kidney outcome
 - Absolute risk reduction = **1.7%** at 3 years
- **Kidney benefits of finerenone were clinically relevant**
 - NNT to prevent one kidney outcome event over 3 years = **60**

*Time to kidney failure, sustained $\geq 57\%$ decrease in eGFR from baseline, or renal death
Filippatos G, *et al.* ESC 2021; abstract 7161

KDIGO Guidelines – Chapter 1. Comprehensive care in patients with diabetes and CKD

Therapeutical approach for improving outcomes in patients with diabetes and CKD

*ACEi or ARB should be first-line therapy for hypertension when albuminuria is present, otherwise dihydropyridine CCB or diuretic can also be considered; all three classes often needed to attain BP targets

[†]Finerenone is currently the only nonsteroidal MRA with proven clinical kidney and cardiovascular benefits

Conclusions

Finerenone is a nonsteroidal MR antagonist that targets MR overactivation, a major driver in DKD, and has high affinity for MR and a unique binding mode

DKD increases the risk of cardiovascular disease and can shorten life expectancy, and patients often experience renal progression despite standard treatment

Finerenone has been studied in phase 2 clinical trials in patients with CHF and mild to moderate CKD, where it was found to be tolerable and associated with smaller increases in serum potassium vs spironolactone and a similar reduction in NT-proBNP and in UACR vs spironolactone

In a phase 2 clinical trial in patients with type 2 diabetes and persistent albuminuria (UACR ≥ 30 mg/g) who were receiving a RAS blocker, finerenone led to a dose-dependent reduction in albuminuria at day 90 with similar adverse events to placebo

Finerenone has also been studied in two phase 3 clinical trials in patients with DKD showing significant positive effects both on cardiac and renal outcomes

Finally, combination therapy with RAASi and/or SGLT2i (and GLP-1 agonists) could provide a 360° nephroprotection in diabetic and non – diabetic patients

A word cloud of the word "Grazie" in various colors (red, orange, yellow, green, blue, purple) and fonts (serif, sans-serif, script), arranged in a heart shape. The word is repeated many times in different sizes and orientations, creating a dense, affectionate visual.
